

B.3 development pilot — c plus — b3_mother_00_c_plus

One sphere moved; fixed z0 / ±12 mm routes; pair decision: route value not identifiable

Saved actual continuum endpoint in world XYZ

Complete Task + original independent gates required

Input	Outcome / saved horizon	I_route (rad/s)	Related sphere T_route min (mm)	Related sphere full min (mm)
z0	PASS / 27.000 s	0.108602	25.884	25.884
z+	PASS / 27.000 s	0.111963	25.778	25.778
z-	PASS / 27.000 s	0.105570	25.861	25.861

I_route = RMS of the saved 17-D QP nominal-to-selected command norm over the frozen window. The nominal diagnostic includes the original velocity-bound clipping; source vectors were not logged. Clearance covers continuum collision geoms versus this moved sphere, at independently saved 2 ms states. No full quality value is credited to failed/ineligible prefixes. A projected endpoint path is not whole-arm clearance. Qualifying preferred direction for this side: none established. Deployment: NOT_MET.
